

Abstract

A closing lever (9, 10) is provided for housing-shaped cable connectors (1, 2) consisting of an upper and a lower component on one of the housing components (1). This closing lever operates to close both housing components (1, 2) in conjunction with a cam (11) on the other housing component. This configuration ensures reliable closing without special exertion of force for the purpose of virtually automatically connecting two cables to each other.
